ABSTRACT

1	A microfabricated probe array for nanolithography and process
2	for designing and fabricating the probe array. The probe array consists of
3	individual probes that can be moved independently using thermal bimetallic
4	actuation or electrostatic actuation methods. The probe array can be used to
5	produce traces of diffusively transferred chemicals on the substrate with sub-1
6	micrometer resolution, and can function as an arrayed scanning probe
7	microscope for subsequent reading and variation of transferred patterns.
